(a) priors over the nomogram
$q = 0.95$: Beta(0.23, 22.3)
$q = 0.975$: Beta(0.49, 48.9)
$q = 0.99$: Beta(0.83, 81.9)
Beta(1, 99)
$P(\pi_{\text{LNI}} > x)$
x
(b) where MAP and Bayes part
$\kappa = 1/\pi_{\text{tail}}$
Bayes aggressive, MAP not
Patient A, 2004
$\kappa = \Delta U_{\text{tail}}/\Delta C$
tail mass π_{tail}
(c) what a scan is worth
$\pi = 0.01$
$\pi = 0.02$
value of scan, quality adjusted days
prior π_{LNI}
